

The required problems are Exercises 6.1, 6.3, and 6.4. Please let me know if any of the problems are unclear or have typos.

**Exercise 6.1.** Recall that  $T^2 = S^1 \times S^1$  is the two-torus; informally  $T^2$  is the surface of a donut. Fix any point  $x \in T^2$ ; show that  $T^2 - \{x\}$  deformation retracts to the figure-eight graph. Illustrate your proof with useful figures.

**Exercise 6.2.** [A version of Exercise 14, page 39, of Hatcher's book.] Given topological spaces  $X$  and  $Y$  we equip  $Z = X \times Y$  with the product topology. Let  $p: X \times Y \rightarrow X$  be projection to the first factor; that is  $p(a, b) = a$ . Define  $q: X \times Y \rightarrow Y$  to be projection to the second factor.

Fix  $x \in X$  and  $y \in Y$ . Prove that the homomorphism

$$p_* \times q_*: \pi_1(X \times Y, (x, y)) \rightarrow \pi_1(X, x) \times \pi_1(Y, y)$$

is an isomorphism. (Essentially you are being asked to carefully reprove Proposition 1.12, using the notion of projections.)

**Exercise 6.3.** The *real projective space*  $\mathbb{R}P^n$  is the space of lines through the origin in  $\mathbb{R}^{n+1}$ . We equip  $\mathbb{R}P^n$  with its usual topology, coming from the round metric; the distance between distinct lines  $L, M \subset \mathbb{R}^{n+1}$  is the smaller of the two angles made by  $L$  and  $M$  in the plane they span.

- Exhibit a two-fold covering map  $p: S^n \rightarrow \mathbb{R}P^n$ .
- Deduce that  $\pi_1(\mathbb{R}P^n) \cong \mathbb{Z}/2\mathbb{Z}$ , when  $n \geq 2$ .
- Briefly discuss the cases of  $n = 0$  and  $n = 1$ . Give pictures.

**Exercise 6.4.** Suppose that  $p: \tilde{X} \rightarrow X$  is a  $d$ -fold covering map and that  $\tilde{X}$  is path-connected. Prove that  $\text{Deck}(p)$  has at most  $d$  elements. Give examples which do and which do not realize this bound.

**Exercise 6.5.** [Hard.] Let  $X$  and  $Y$  be copies of the two-sphere and choose distinct points  $p, p' \in X$  and  $q, q' \in Y$ . Define

$$Z = X \sqcup Y / p \sim q, p' \sim q'$$

to be the quotient space. That is,  $Z$  is obtained from the disjoint union of  $X$  and  $Y$  by identifying  $p$  with  $q$  and  $p'$  with  $q'$ . Draw a picture of  $Z$ . Compute  $\pi_1(Z)$  and carefully justify your reasoning.
